Respiratory Protection – Air Purifying Respirators.

1. Air purifying respirators are recommended for oxygen deficient atmospheres. True __, False __.

2. Fit testing is done primarily to ensure that the strap is positioned correctly for the least amount of discomfort. True __, False __.

3. Failure of the user to shave, even for one day, may cause a respirator not to function correctly. True __, False __.

4. An air purifying respirator provides excellent protection against harmful gases and vapors. True __, False __.

5. Wearing a correctly-fitting respirator is the preferred way to control a worker's exposure to harmful dust. True __, False __.

6. Positive and negative pressure seal checks should be done a) daily, b) weekly, c) frequently, d) monthly, e) each time you use the respirator.

7. Seal checks qualify as fit tests. True __, False __.

8. N, R, and P are measures of resistance to oil particles with N meaning the respirators are not resistant, R meaning the respirator can be used when oil particles are present and P meaning the respirator will protect against oil particles and can be used for more than one workshift. True __, False __.

9. N99 means the respirator is not resistant to oil particles and is designed to remove at least 99% of the particles for which it is designed. True __, False __.

10. Gas and vapor respirators will also protect against airborne particles. True __, False __.

11. Medical testing is important to determine if you can breath properly with the resistance caused by a respirator. True __, False __.

12. You must follow manufacturer's recommendations precisely when cleaning and storing your respirator. True __, False __.
